Lesson 4 - Part 2 · The Burning River That Started a Movement

In the 1880s, industry began to grow rapidly along the Cuyahoga River in the city of Cleveland. This industrial growth provided steady jobs to people in the area. Meanwhile, steel mills and factories started dumping large amounts of waste into the river. Although the river became polluted, most people simply regarded this as a sign of the area's economic success. In June 1969, the polluted river caught fire. The likely cause was a burning flare falling from a train, which set fire to oil-soaked waste beneath a bridge. At that time, few people in Cleveland cared. This was because fires had been recorded on the Cuyahoga more than ten times before, and some of them had been much worse. However, it wasn't long before the 1969 fire became famous. This was thanks to an article published in Time magazine that year. The article featured a shocking photograph of flames and smoke rising from the river. But this was not a photograph of the 1969 fire, which was put out so quickly that nobody took a picture of it. In fact, it was a picture of a much worse fire that had occurred on the river several years earlier. Still, the image had a great impact on people. Around that time, the attitudes of Americans toward environmental problems were starting to change. More and more people were becoming aware of the need to protect the environment, and the shocking image of the burning river sparked public anger about water pollution. As a result, the Cuyahoga River fire of 1969 became a symbol of pollution. A national environmental awareness event was held on April 22, 1970, which later became known as the first Earth Day. And in 1972, national water quality standards were established with the passage of the Clean Water Act.

Lesson 4 - Part 3 · Exposing the Harsh Reality of Child Labor

In the 19th century, the Industrial Revolution led to a dramatic increase in factory production in the United States. The demand for workers increased, and many new positions were filled by children. By 1900, about twenty percent of all children in the United States were employed, and some of those working in factories were only four years old. The work was difficult and dangerous, leaving many child laborers with health problems. Factory owners turned to child labor for several reasons. For example, children could be paid less than adult workers. They were also less likely to go on strike. Lewis Hine, a teacher and photographer, wanted to reveal how cruel this system was. So he quit his teaching job and started to work for the National Child Labor Committee as an investigative photographer. He gained access to factories by pretending to have different jobs like insurance agent or fire inspector. Once inside, he would photograph the children working there. He would also ask their names and ages and record information about their living and working conditions. From 1908 to 1912, he secretly gathered information and took photographs to expose factory owners who were taking advantage of helpless children. Hine's photographs captured young children doing all sorts of jobs. These included picking vegetables, weaving baskets, and even handling dangerous equipment. What is more, the children's faces showed the tragic impact of hard labor. When people saw the children's joyless expressions, they could not help but feel heartbroken. The pictures were later shown in exhibitions, lectures, magazine articles, and so on. As a result, the public realized just how serious the situation was. Soon, many states passed stronger laws to ban the employment of children. In 1938, the United States Congress passed an act that made it illegal for children under sixteen to work in factories during school hours. These examples show that photographs can bring meaningful change to society. They prove that, sometimes, a picture truly is worth a thousand words.

공통영어 3 - 본문 2 · Melbourne's Urban Forest Strategy (배경)

The story behind these emails begins with Melbourne's Urban Forest Strategy plan, a response to Australia's millennium drought. This drought lasted from the late 1990s to 2010. By the time it ended, 40 percent of the city's 77,000 trees were in a state of declining health. Furthermore, the overall number of trees was decreasing. As a result, the amount of shade provided by trees within the city, also known as canopy cover, decreased. The loss of canopy cover is a major threat to urban environments because it raises temperatures. Higher temperatures in cities can be dangerous for residents, as they increase the risk of heat exhaustion. They also lead to a rise in the use of air-conditioning. This speeds up climate change by increasing energy consumption and greenhouse gas emissions.

공통영어 3 - 본문 3 · Urban Forest Visual (지도와 이메일 기능)

Something had to be done to deal with the loss of Melbourne's trees. In 2012, the city government announced its Urban Forest Strategy plan. It set the ambitious goal of planting more than 3,000 trees every year for the next twenty years. The plan also involved the creation of an online map called the Urban Forest Visual. This interactive map shows the location of every single tree in the city's parks and along its roads. It uses colors and symbols to indicate each tree's age and genus. Also, users can click on a tree to find out its species and even send it an email. At first, the "Email this tree" function had a specific purpose. It was designed to allow people to easily inform council workers about trees that were damaged or in poor health.

공통영어 3 - 본문 4 · Trees Receiving Love Letters

After the map was posted online, something unexpected happened. The trees started

receiving thousands of emails, but many of them were not reports about damage or poor health. Instead, they were love letters, poems, greetings, and messages expressing appreciation for the trees. One person wrote, "I love the way the light shines on your leaves and how your branches hang so low. It is almost like you are trying to hug me." The tree mail phenomenon quickly spread, and people all over the world started sending messages. A message that was sent all the way from Russia said, "When I read about this wonderful project, I was inspired to write to you, even though I live thousands of miles away. Although we are separated by a great distance, we share the same planet and the same environment. Perhaps one day we will meet. Until then, I hope you can stay healthy and strong." The global popularity of the tree mail phenomenon reminds us that we are all connected to nature, and we are all involved in building a more sustainable world. Without collective action from people across the globe, we would have little hope of saving our planet for future generations.
